2 Glossary

Availability	Ensuring timely and reliable access to and use of information.
Confidentiality	Preserving authorized restrictions on information access and disclosure, including means for protecting personal privacy and proprietary information.
Integrity	The property that data has not been altered in an unauthorized manner. Data integrity covers data in storage, during processing, and while in transit.
Impact Level	The magnitude of harm that can be expected to result from the consequences of unauthorized disclosure of information, unauthorized modification of information, unauthorized destruction of information, or loss of information or information system availability.
Impact Analysis	The analysis conducted by an organizational official to determine the extent to which changes to the information system have affected the security state of the system.
Risk Management	The process of managing risks to organizational operations (including mission, functions, image, or reputation), organizational assets, or individuals resulting from the operation of an information system, and includes: 1) the conduct of a risk assessment; 2) the implementation of a risk mitigation strategy; and 3) employment of techniques and procedures for the continuous monitoring of the security state of the information system
Security Category	The characterization of information or an information system based on an assessment of the potential impact that a loss of confidentiality, integrity, or availability of such information or information system would have on organizational operations, organizational assets, or individuals

3 Introduction

The emerging needs to safeguard the information's assets in any organization has become crucial and classifying those assets is the basis for identifying the required protection levels and controls. Data and Information Systems Security Classification Mapping guidelines have been designed for government entities to fulfill their data and information systems` security classification requirements. The mapping process has been defined with a given logical structure to address all aspects related to mapping that civil organizations in particular needs to adopt for its information assets (data and systems) to the defined categories by the circular 118/2011.

ITA	Governance & Standards Division	Document Name: Data & Information Systems Security classification Mapping	Document ID: GS_G3_Security_Classification_Mapping	Version: 1.0	Issue Date: 30/07/2017	Page: 7
-----	---------------------------------------	---	---	-----------------	---------------------------	---------

4 Purpose

The purpose of this document to assist government entities in classifying their data and information systems in accordance with Royal Decree 118/2011 on Security Classification. These guidelines provide a mechanism that facilitates the process of assigning proper sensitivity levels of the given data based on the common security objectives CIA (Confidentiality, Integrity, and Availability).

-----	---------------------------------------	---	---	-----------------	---------------------------	---------

5 Risk Management

Government organization should adopt Risk Management Mechanism in order to define all its valuable assets and identify the associated risks for them. That will give a clear indication on the required level of protections and setting priorities for managing the identified risks.

This exercise is very essential and it simplifies Data Classification process implementation across the organization. Risk Management Framework published by ITA could be used as a good reference which covers all the main complements to achieve proper risk management in the organization.

Five risk impact levels have been defined as the following:

- Very High
- High
- Medium
- Low
- Very Low

Risk Impact Level	Description
Very High	Very high risk means that a threat event could be expected to have multiple severe or catastrophic adverse effects on organizational operations, organizational assets, individuals, other organizations, or the Nation.
High	High risk means that a threat event could be expected to have a severe or catastrophic adverse effect on organizational operations, organizational assets, individuals, other organizations, or the Nation.
Moderate	Moderate risk means that a threat event could be expected to have a serious adverse effect on organizational operations, organizational assets, individuals, other organizations, or the Nation.
Low	Low risk means that a threat event could be expected to have a limited adverse effect on organizational operations, organizational assets, individuals, other organizations, or the Nation.
Very Low	Very low risk means that a threat event could be expected to have a negligible adverse effect on organizational operations,

ITA	Governance & Standards Division	Document Name: Data & Information Systems Security classification Mapping	Document ID: GS_G3_Security_Classification_Mapping	Version: 1.0	Issue Date: 30/07/2017	Page: 9

-----	---------------------------------------	---	---	-----------------	---------------------------	-------------

6 Security Classifications

As defined by circular 118/2011, 4 data classification levels have been defined and should be followed by all government entities:

- Top Secret (سري للغاية)
- Secret (سري)
- Restricted (محدود)
- Confidential (مكتوم)

Government organization should need to include a fifth level for public or open data to fulfill the requirements of the Open Data Policy. The government organization should be able to assign a proper security classification level after conducting an impact analysis for its data.

ITA	Governance & Standards Division	Document Name: Data & Information Systems Security classification Mapping	Document ID: GS_G3_Security_Classification_Mapping	Version: 1.0	Issue Date: 30/07/2017	Page: 11
-----	---------------------------------------	---	---	-----------------	---------------------------	-------------

7 Security Objectives and Potential Losses

These guidelines address the below defined security objectives as basis for the impact analysis with given potential losses.

Security Objective	Definition	Potential Loss
Confidentiality	Preserving authorized restrictions on information access and disclosure, including means for protecting personal privacy and proprietary information	System and data confidentiality refers to the protection of information from unauthorized disclosure. The impact of unauthorized disclosure of confidential information can range from the jeopardizing of national security to the disclosure of Privacy data. Unauthorized, unanticipated, or unintentional disclosure could result in loss of public confidence, embarrassment, or legal action against the organization.
Integrity	Guarding against improper information modification or destruction, and includes ensuring information non-repudiation and authenticity	System and data integrity refers to the requirement that information be protected from improper modification. Integrity is lost if unauthorized changes are made to the data or IT system by either intentional or accidental acts. If the loss of system or data integrity is not corrected, continued use of the contaminated system or corrupted data could result in inaccuracy, fraud, or erroneous decisions. Also, violation of integrity may be the first step in a successful attack against system

ITA	Governance & Standards Division	Document Name: Data & Information Systems Security classification Mapping	Document ID: GS_G3_Security_Classification_Mapping	Version: 1.0	Issue Date: 30/07/2017	Page: 12
-----	---------------------------------------	---	---	-----------------	---------------------------	-------------

		availability or confidentiality. For all these reasons, loss of integrity reduces the assurance of an IT system.
Availability	Ensuring timely and reliable access to and use of information.	If a mission-critical IT system is unavailable to its end users, the organization's mission may be affected. Loss of system functionality and operational effectiveness, for example, may result in loss of productive time, thus impeding the end users' performance of their functions in supporting the organization's mission.

-----	---------------------------------------	---	---	-----------------	---------------------------	-------------

8 Mapping Process to Security Classification

Government organization could use the mapping process provided in these guidelines to help in classifying its information to the defined security classification levels in Circular 118/2011. The below diagram summarize the mapping process for assigning the right security classification level.

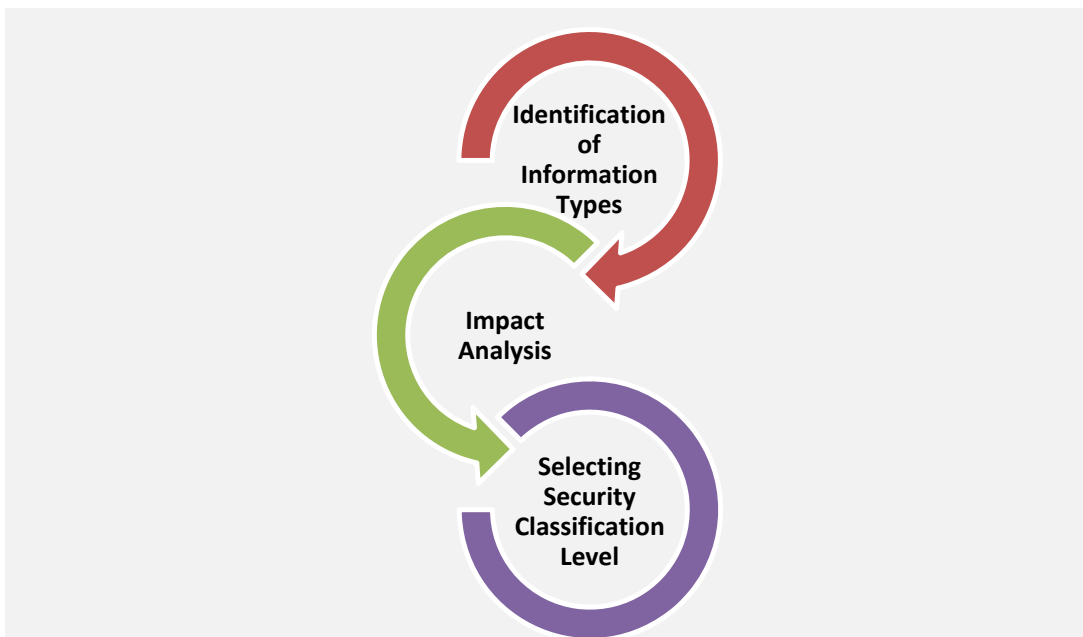

Diagram 1. Mapping Process to Security Classifications

ITA	Governance &	Document Name:	Document ID:	Version:	Issue Date:	Page:
	Standards	Data & Information Systems	GS_G3_Security_Classification_Mapping	1.0	30/07/2017	14
	Division	Security classification Mapping				

8.1 Identification of Information Types

starting any classification process. It needs to have a comprehensive list of information types that reflects all their business related information (for example: civil data and records, financial information, Healthcare records, etc.).

OeGAF Business Reference Model (BRM)

Government organizations can refer to the Business Reference Model (BRM) that defines different lines of business and the associated government functions of the Oman Government that cuts across the boundaries of different agencies. BRM covers all domains of government business along with the underlying business functions.

BRM provides an overall map for all the government business that was used to instantiate Data Sets of Oman's government Data. The data sets have been categorized into two main layers just like how the lines of businesses were categorized in the BRM document:

- A. Information related to Mission Critical Areas (Services to Citizens, Residents, & Commercial Establishments)
- B. Information related to Internal Corporate and Support Services

These data sets could be used as a good reference identify the core national information types and enable organizations to address them while implementing data classifications. The provided information types might though cover only few information types that are processed by IT Systems. At the same time, organizations may list some information types that might not covered on the provided data sets and information types that are listed in the appendix of these guidelines. Furthermore a single information system could process multiple information types that all need to be identified and listed for the impact analysis.

8.2 Impact Analysis

ITA	Governance &	Document Name:	Document ID:	Version:	Issue Date:	Page:
	Standards	Data & Information Systems	GS_G3_Security_Classification_Mapping	1.0	30/07/2017	15
	Division	Security classification Mapping				

Impact analysis is a critical step to help assigning a proper risk level for a given information asset. To do so security objectives should be outlined and impact level should be studied and selected. The below table provides a scheme to conduct the impact analysis and defines each impact level for each security objective after addressing potential threats (Risk Management Framework provides a list of threats that could be used for this impact analysis).

ITA	Governance & Standards Division	Document Name: Data & Information Systems Security classification Mapping	Document ID: GS_G3_Security_Classification_Mapping	Version: 1.0	Issue Date: 30/07/2017	Page: 16
-----	---------------------------------------	---	---	-----------------	---------------------------	-------------

Security Objective / Impact Level	Very Low	Low	Medium	High	Very High
<p>Confidentiality Preserving authorized restrictions on information access and disclosure, including means for protecting personal privacy and proprietary information</p>	<p>The unauthorized disclosure of information could be expected to have a negligible adverse effect on organizational operations, organizational assets, or individuals.</p>	<p>The unauthorized disclosure of information could be expected to have a limited adverse effect on organizational operations, organizational assets, or individuals.</p>	<p>The unauthorized disclosure of information could be expected to have a serious adverse effect on organizational operations, organizational assets, or individuals.</p>	<p>The unauthorized disclosure of information could be expected to have a severe or catastrophic adverse effect on organizational operations, organizational assets, or individuals.</p>	<p>The unauthorized disclosure of information could be expected to have a multiple severe or catastrophic adverse effect on organizational operations, organizational assets, or individuals.</p>
<p>Integrity Guarding against improper information modification or destruction, and includes ensuring</p>	<p>The unauthorized modification or destruction of information could be expected to have a negligible adverse effect on organizational</p>	<p>The unauthorized modification or destruction of information could be expected to have a limited adverse effect on organizational</p>	<p>The unauthorized modification or destruction of information could be expected to have a serious adverse effect on organizational</p>	<p>The unauthorized modification or destruction of information could be expected to have a severe or catastrophic adverse effect on organizational</p>	<p>The unauthorized modification or destruction of information could be expected to have a multiple severe or catastrophic adverse effect on organizational</p>

ITA	Governance & Standards Division	Document Name: Data & Information Systems Security classification Mapping	Document ID: GS_G3_Security_Classification_Mapping	Version: 1.0	Issue Date: 30/07/2017	Page: 17
-----	---------------------------------	--	---	-----------------	---------------------------	-------------

information non-repudiation and authenticity	operations, organizational assets, or individuals.	operations, organizational assets, or individuals.	operations, organizational assets, or individuals.	operations, organizational assets, or individuals.	operations, organizational assets, or individuals.
Availability Ensuring timely and reliable access to and use of information.	The disruption of access to or use of information or an information system could be expected to have a negligible adverse effect on organizational operations, organizational assets, or individuals.	The disruption of access to or use of information or an information system could be expected to have a limited adverse effect on organizational operations, organizational assets, or individuals.	The disruption of access to or use of information or an information system could be expected to have a serious adverse effect on organizational operations, organizational assets, or individuals.	The disruption of access to or use of information or an information system could be expected to have a severe or catastrophic adverse effect on organizational operations, organizational assets, or individuals.	The disruption of access to or use of information or an information system could be expected to have a multiple severe or catastrophic adverse effect on organizational operations, organizational assets, or individuals.

Table 3. Impact Analysis

ITA	Governance & Standards Division	Document Name: Data & Information Systems Security classification Mapping	Document ID: GS_G3_Security_Classification_Mapping	Version: 1.0	Issue Date: 30/07/2017	Page: 18
-----	---------------------------------	---	---	-----------------	---------------------------	-------------

8.3 Assign Information Security levels

After information types have been identified, the next step is to take each and every single information type and assign its impact level against each security objective as in the below formula:

Security Category_{information type} = {(confidentiality, impact), (integrity, impact), (availability, impact)}

The maximum value will be always considered. For example, If any of the given variables above contains a “High” value, the overall result would be “High”, the same is applicable for the “Very High”. In some cases the value of impact level might be “not applicable (N/A)” against one of the security levels, in many cases confidentially for instance.

Examples

Below are some examples that clarify how to assign security levels that could be mapped to the security classifications.

- If the identified Information type is administrative, applying the defined impact analysis scheme should look like the following:

Security Category_{administrative information} = {(confidentiality, LOW), (integrity, LOW), (availability, VERY LOW)}.

- If the identified information type is legal, applying the defined impact analysis scheme should look like the following:

Security Category_{Legal} = {(confidentiality, VERY HIGH), (integrity, HIGH), (availability, HIGH)}.

8.4 Assign Systems Security Classification

ITA	Governance & Standards Division	Document Name: Data & Information Systems Security classification Mapping	Document ID: GS_G3_Security_Classification_Mapping	Version: 1.0	Issue Date: 30/07/2017	Page: 19
-----	---------------------------------------	---	---	-----------------	---------------------------	-------------

After information types have been identified, the next step is to take each and every single information type and assign its impact level against each security objective as in the below formula:

Security Category_{information type} = {(confidentiality, impact), (integrity, impact), (availability, impact)}

The maximum value will be always considered. For example, If any of the given variables above contains a “High” value, the overall result would be “High”, the same is applicable for the “Very High”. In some cases the value of impact level might be “not applicable (N/A)” against one of the security levels, in many cases confidentially for instance.

Examples

Below are some examples that clarify how to assign security levels that could be mapped to the security classifications.

- If the identified Information type is administrative, applying the defined impact analysis scheme should look like the following:

Security Category_{administrative information} = {(confidentiality, LOW), (integrity, LOW), (availability, VERY LOW)}.

- If the identified information type is legal, applying the defined impact analysis scheme should look like the following:

Security Category_{Legal} = {(confidentiality, VERY HIGH), (integrity, HIGH), (availability, HIGH)}.
